

Apple Website Clone

A fully responsive, multi-page Apple Store clone — recreating the premium look, feel, and functionality of Apple.com with modern web technologies.

ACADEMIC PROJECT

WEB DEVELOPMENT

Developed by Jashti Hemendra

Project Overview

This project is a **fully responsive multi-page Apple Store clone** inspired by Apple's official website. It faithfully recreates the premium aesthetic of Apple.com — from the animated hero section to the glassmorphism navigation bar — while delivering real functionality including product browsing, authentication, purchasing, and order tracking. Every page, interaction, and animation has been crafted to mirror the seamless experience users expect from Apple's digital ecosystem.

50 Pages

Fully structured HTML pages covering every section of the Apple Store

7 Product Categories

Mac, iPhone, iPad, Apple Watch, AirPods, Accessories, and Entertainment

End-to-End Flow

From homepage visit to order placement and tracking — all in one app

Technologies Used

Built with a focused, modern stack — no frameworks, no libraries. Every interaction and animation is handcrafted using core web technologies.

HTML5

Semantic, accessible markup across 50 pages with clean document structure and SEO-friendly elements.

CSS3

Custom animations, glassmorphism effects, flexbox and grid layouts, hover transitions, and responsive breakpoints.

JavaScript

Dynamic pricing, form validation, DOM manipulation, scroll animations, and interactive UI components.

Local Storage

Persistent login sessions and order data stored client-side — no backend required for core functionality.

Project Statistics

A substantial, production-grade codebase built entirely from scratch — demonstrating depth, consistency, and attention to detail across every layer of the application.

50

HTML Pages

Individual pages for every product category, authentication, and user flow

1

CSS File

A single, unified stylesheet ensuring design consistency across the entire project

5

JS Files

Modular JavaScript files handling logic for buy flow, login, animations, and more

52

Local Images

Curated product and UI images stored locally for fast, offline-capable rendering

Features Overview

Every feature mirrors the real Apple Store experience — from browsing products to completing a purchase with AppleCare+ and delivery options.

Apple-Style Homepage

Animated hero section with floating product imagery, fade-up scroll reveals, and a sticky glassmorphism navigation bar that blurs the background elegantly.

Product Pages

Dedicated pages for Mac, iPhone, iPad, Apple Watch, AirPods, Accessories, Entertainment, and Support — each with Apple-inspired typography and spacing.

Authentication

Login and Sign Up pages with form validation, error states, and Local Storage-based session persistence for a seamless return experience.

Buy Page

Full purchasing flow with product selection, dynamic pricing, quantity controls, promo code support, AppleCare+ toggle, delivery options, and live order summary.

Buy Page Workflow

The Buy page is the most feature-complete section of the project — a fully interactive purchasing experience with real-time price calculations and a live order summary that updates as the user makes selections.

What the User Experiences

- **Product Selection** — Choose model, color, and storage with instant visual feedback
- **Dynamic Pricing** — Price updates in real time as options are toggled
- **AppleCare+ & Delivery** — Optional add-ons with clear pricing breakdown
- **Promo Code** — Discount field with validation and live total adjustment
- **Payment & Order Summary** — Multiple payment methods with a persistent live summary panel

My Orders & Application Flow

Orders are saved to **Local Storage**, allowing users to revisit their order history without a backend. The full application flow is seamless — from first visit to order confirmation.

This end-to-end flow demonstrates a complete e-commerce user journey — all powered by client-side technologies with no server dependency for core functionality.

My Orders Page: Displays all past orders with product details, pricing breakdown, delivery status, and order timestamps — all retrieved from Local Storage.

UI/UX Design Highlights

Every visual detail is intentional — inspired by Apple's design language, built with modern CSS techniques, and tuned for a polished, portfolio-ready experience.

Glassmorphism

Frosted glass navigation bar and cards with backdrop-filter blur, semi-transparent backgrounds, and subtle borders.

Hero Animations

Floating product imagery with smooth keyframe animations and fade-up scroll reveals triggered on intersection.

Hover Effects

Card lift animations, scale transitions, and shadow depth changes on hover — creating a tactile, responsive feel.

Apple Typography

Generous whitespace, consistent letter-spacing, and a clear visual hierarchy mirroring Apple's typographic system.

Folder Structure & Learning Outcomes

Project Folder Structure

```
apple-clone/  
├── index.html  
├── style.css  
├── script.js  
├── buy.js  
├── login.js  
└── images/  
    └── 52 assets
```

Clean, modular architecture — one CSS file for consistency, separate JS files per feature, and a dedicated images folder for all 52 local assets.

Skills Demonstrated

- Responsive Web Design**
Mobile-first layouts with fluid breakpoints for desktop, tablet, and mobile.
- CSS Animations & Transitions**
Keyframe animations, transitions, and scroll-triggered reveals without external libraries.
- DOM Manipulation**
Dynamic content updates, event handling, and real-time UI state management.
- Form Validation & Local Storage**
Client-side validation with persistent data storage for login sessions and order history.

Future Enhancements

This project lays a strong foundation. The roadmap focuses on evolving from a client-side clone to a full-stack, production-ready e-commerce platform.

1

Backend Integration

Node.js + MongoDB for persistent user accounts, product database, and server-side order management.

2

Payment Gateway

Stripe or Razorpay integration for real payment processing with secure checkout.

3

User Profiles

Personalized dashboards with order history, saved addresses, and wishlists.

4

Admin Dashboard

Product management, order tracking, and analytics for site administrators.

Thank you for viewing. This project represents a comprehensive exploration of modern front-end development — built with precision, designed with intention, and crafted to impress.

THANK
YOU
